THE PROJECT

Our client is considered one of the prime locations in KL which specialises in carefully selected cuts. They are known as the best places for steak in Malaysia. Their cooking method involves much grilling and roasting which causes even faster build-up of fats and oils. Our client's Kitchen Exhaust System comprises one canopy hood with approximately 30ft of ductwork and an exhaust fan unit.

THE CONCERN

The Kitchen's exhaust system was clogged due to a method of cooking consisting of grilling, deep frying, roasting which causes fast build-up of fats and oils and due to the high-volume cooking and irregular cleaning service. A kitchen system that is clogged requires more energy to run hence it is inefficient.

THE SOLUTION

To chemically clean and remove all grease particles which increases the efficiency and life expectancy of the Kitchen Exhaust System.

RESULTS

A total grease free kitchen exhaust system and efficient Exhaust System.
